Hi. My name is Steve Perry and I've been teaching with San Jose State University since 2002. I'm also a full time professor at Palomar Community College in San Diego County. I've been working in Information Technology for over 24 years, before I became an instructor. So I have a lot of experience with application and web development. My main specialties are web development and also database work, SQL, data modeling, that sort of thing. Here, at School of Information I've taught 242 in Database, 240 and HTML and CSS. And, I teach a lot of 246 classes: PHP, JavaScript, MySQL, and Bootstrap are the main ones I'm teaching now. I've taught Java too as well and Java Server Pages. So if you have any questions about seeking a career in a web development related field, whether or not it's in librarianship, contact me. I'll try to help you sort out which electives and what might be a great path for you to take to achieve your goals. Remember also that we have career pathways on the School website. As well as when you click Current Students you will see links for the Career Development Resource and the Advising Toolkit. And these are great resources to use as well. Alright. Let me know if you have any questions.
